

Distributed systems with MsgFlo

Flow-Based Programming over message queues

Internet of Things devroom
FOSDEM 2017

msgflo.org
[@flowhub_io](https://twitter.com/flowhub_io)

Basic MQTT communication

```
// Motor.cpp
```

```
mqtt.subscribe("motor/start", start_motor);
```

```
// Button.cpp
```

```
mqtt.publish("motor/start", button_pressed);
```

+ Works OK

- Connections hidden in code
- Hardcoded functionality

MsgFlo participant

```
// Motor.cpp
```

```
mqtt.subscribe("motor/start", start_motor);  
mqtt.publish("msgflo/discover", motor_info);
```

```
// Button.cpp
```

```
mqtt.publish("msgflo/discover", button_info);  
mqtt.publish("button/pressed", button_pressed);
```

- + Devices describe themselves
- + Reusable components
- ! Something need to connect the topics

MsgFlo discovery message

```
{  
  "component": "fosdem2017/Button",  
  "role  "id": "button",  
  "label": "This is a button, it can be pressed",  
  "icon": null,  
  "outports": [  
    {"id     "type": "boolean"  
     "queue   ],  
  "imports": []  
}
```

System of participants

```
# motorcontrol.fbp  
button(Button) PRESSED → START motor(Motor)  
...  
motor RUNNING → RED warninglight(Lamp)
```

```
# bind the queues together  
$ msgflo-setup --forever motorcontrol.fbp
```

Foreign participants

```
# existingdevice.yml
component: c-base/siri
label: c-base siri data rescue probe
imports:
  openurl:
    queue: siri/open
    type: string
```

```
# Send MsgFlo discovery message
# on behalf of device
$ msgflo-register-foreign existingdevice.yml
```

Live programming

```
# start runtime  
$ msgflo --graph motorcontrol.fbp
```

... Open Flowhub in browser

<http://app.flowhub.io/#runtime/endpoint?proto=websocket&address=ws://localhost:3569>

- + Direct access via URL
- + Only browser needed

Convenience libraries

[`msgflo-nodejs`](#): JavaScript on Node.js

[`noflo-runtime-msgflo`](#): NoFlo

[`msgflo-cpp`](#): C++11 on Linux

[`msgflo-python`](#): Python 2.x

[`msgflo-arduino`](#): Arduino on ESP8266

[`! msgflo-rust`](#): Rust, *AMQP only*

Current status

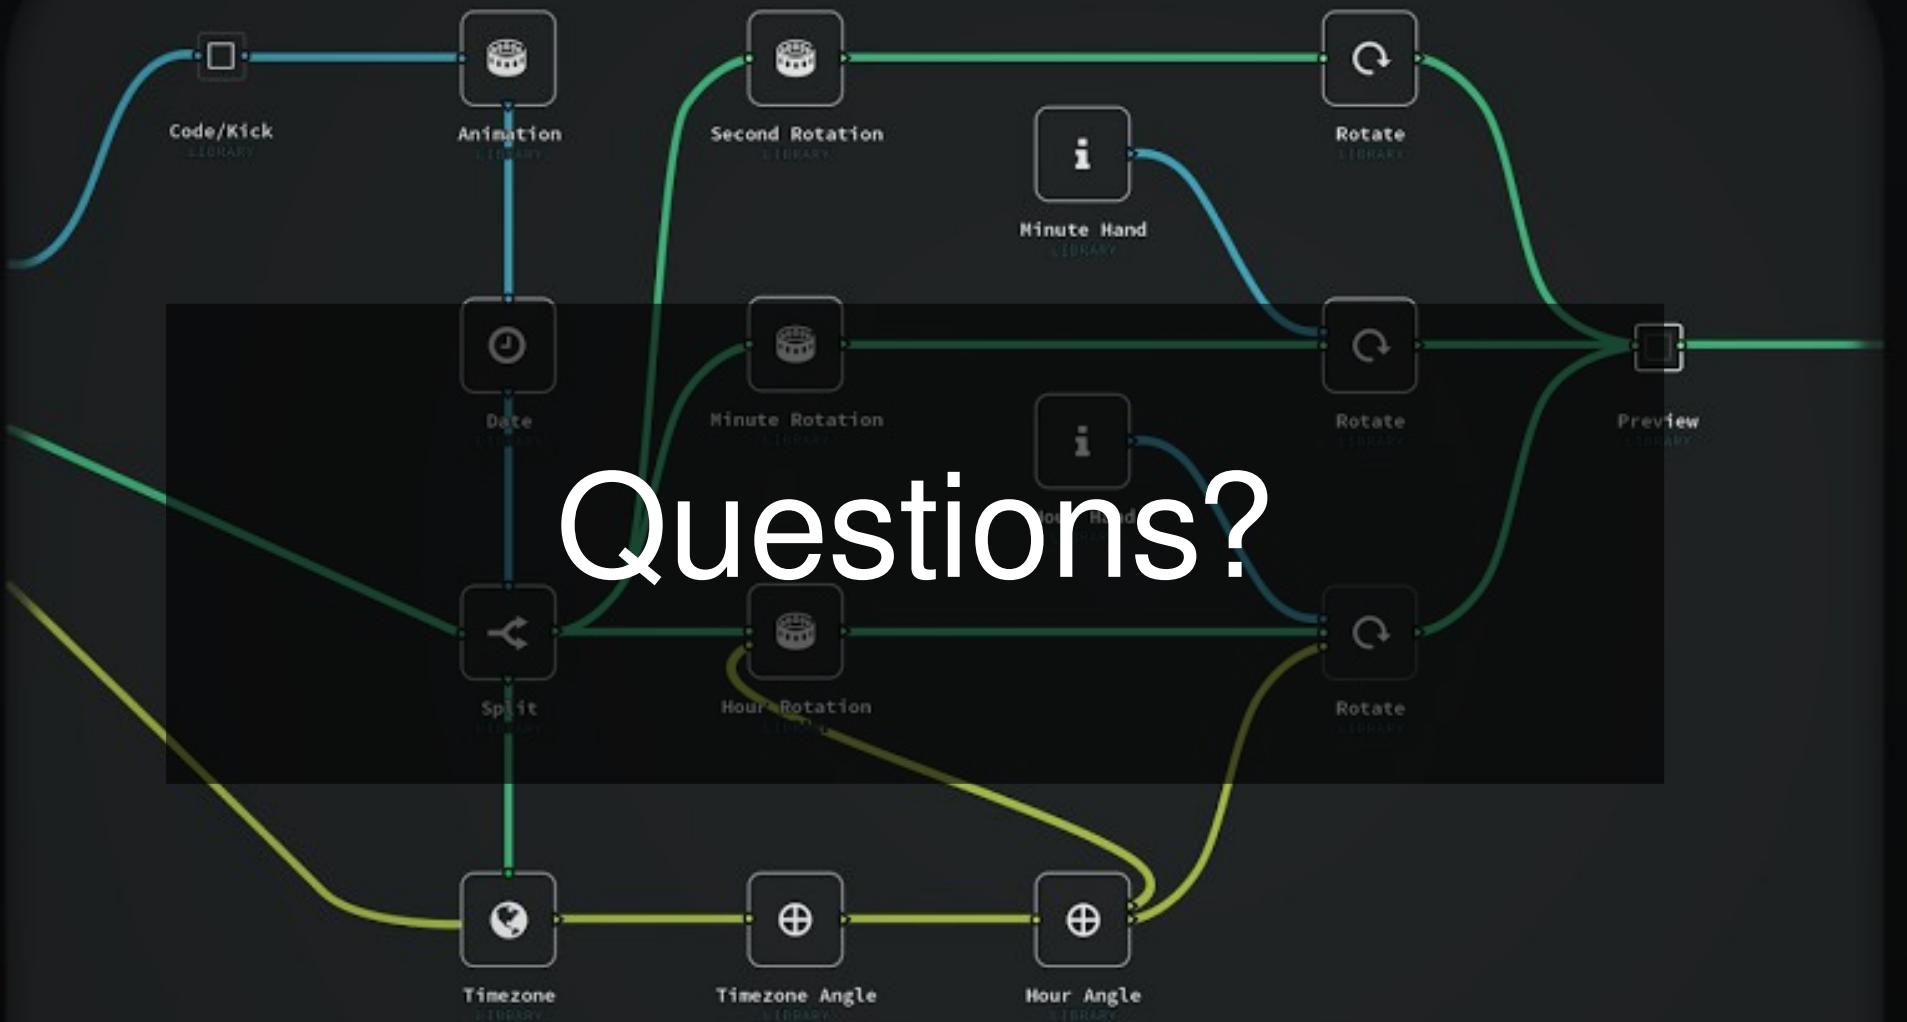

- + Programming model, JavaScript libraries, AMQP support = battle tested
- . MQTT deployed in Berlin, Oslo hackerspaces
- ! MQTT SSL support not tested
- ! Live programming not much tested

Future

- Support RabbitMQ routing on MQTT
- MsgFlo 1.0: Freeze discovery protocol
- Flowhub showing changes from outside automatically (no refresh)
- FBP protocol forwarding. Live-programming all the way down!

Questions?

msgflo.org

flowhub

@jononor

Message payloads
agnostic
but – discovery message can have info

Participant modelling best practices FBP + FSM style

Component library model & tools
